21.1 deaths/100,000 women

COUNTY POPULATION: 118,572

OF WOMEN: 60,720 (51%)

CALHOUN COUNTY

BREAST HEALTH SNAPSHOT

A brief overview of how Calhoun County is doing in the fight against breast cancer

Calhoun County is currently considered a "high" risk county in the state. This means that the county is not currently meeting the Healthy People 2020 targets for late-stage diagnosis of breast cancer and breast cancer mortality.

Healthy People 2020 (HP 2020) is a set of health-related targets for the country that is developed by various U.S. federal agencies. The HP 2020 target for late-stage diagnosis is **38.9 new cases per 100,000 women**. The target for breast cancer mortality is **20.7 deaths per 100,000 women**. As it stands today, it is predicted that while Calhoun County will meet the late-stage diagnosis target by

2020, it will not meet the breast cancer mortality rate target by then.

Calhoun County has an **incidence rate of 110.5 new cases of breast cancer per 100,000 women** and sees, on average, about 80 new cases of breast cancer diagnosed each year.

Some of the most influential factors impacting the state of breast health in Calhoun County include access to care barriers, low health literacy, and its shortage of healthcare professionals and resources.
