25.6 deaths/100,000 women

COUNTY POPULATION: 334,811

OF WOMEN: 164,734 (49%)

MADISON COUNTY

BREAST HEALTH SNAPSHOT

A brief overview of how Madison County is doing in the fight against breast cancer

Madison County is currently considered a "highest" risk county in the state. This means that the county is not currently meeting the Healthy People 2020 targets for late-stage diagnosis of breast cancer and breast cancer mortality and is not currently expected to meet these targets by 2020.

Healthy People 2020 (HP 2020) is a set of health-related targets for the country that is developed by various U.S. federal agencies. The HP 2020 target for late-stage diagnosis is 38.9 new cases per 100,000 women. The target for breast cancer mortality is 20.7 deaths per 100,000 women.

Madison County has an incidence rate of 128.9 new cases of breast cancer per 100,000 women and sees, on average, about 234 new cases of breast cancer diagnosed each year.

Some of the most influential factors impacting the state of breast health in Madison County include access to care barriers, low health literacy, and cultural myths and stigmas.
